## 18. STORAGE OF SEED SAMPLES RECEIVED FOR TESTING

P.K. AGRAWAL

A portion of the seed sample received for testing is required to be stored for future testing if need arises. The quantity of stored seeds should be sufficient for retesting. These samples should be stored for at least two years. Storage conditions may be such that there is practically no loss of viability and seeds are not infested with insects-pests during storage.

The seed samples may be kept either in cloth bag or good quality paper bag. The size and shape of the bag should be uniform (it helps in storing). Proper identification mark should be put both outside and inside of the bag. A small envelope containing the weed seed, inert matter and other crop seed from the initial analytical purity should be kept inside the bag of unanalyzed seed samples for future reference.)

Seeds stored under ambient conditions are attacked by various types of insects-pests. To avoid losses due to insect-pests it is necessary to adopt the following preventive measures.

1. Storage room should be clean and disinfected with residual sprays of insecticide such as malathion 50 EC (one part in 25 parts of water) @ 5 litres per 100 m<sup>2</sup> area or fenitrothion 50 EC (one part in 100 parts of water).

2. Seed should be inspected at fortnightly interval. In the event of detection of any insect infestation, seed must be fumigated under air tight conditions with any one of the following fumigants:

(a) *Aluminium phosphide*: 2-3 tablets of 3 g each per tonne of material with an exposure period of 3-5 days or 1 tablet per m<sup>3</sup> space.

(b) *Ethylene dichloride (EDB)*: 32 g per m<sup>3</sup> space with an exposure period of 5-7 days.

Aluminium phosphide is the safest fumigant. Maximum of 3 fumigation may be given at an interval of 40-60 days, it does not impair seed viability if seed moisture and temperature does not exceed 12% and 35°C respectively.

3. After fumigation seed store should be aerated and cleaned thoroughly. To prevent reinfestation, surface treatment with malathion 50 EC (one part in 100 parts of water) @ 4-5 litre per m<sup>2</sup> area or malathion dust 5% @ 3-4 kg per 100 m<sup>2</sup> should be given. The treatment may be given at an interval of 2-4 weeks depending upon severity of pest occurrence.

If sufficient fund is available, it is advisable to store seed samples under controlled conditions at 15-20°C and 50% RH.
